

## **BioLight**

---

BioLight manufactures veterinary medical devices that use visible light to increase productivity and immunity of livestock. The solution aims to maximize yield with minimal feed cost, feed additives and antibiotic injections.

As food safety is endangered by abuse of antibiotics, pesticides and shortage of food in the world, BioLight hopes to solve these problems.

BioLight was established in 2010 and headquarter is in Seoul, Korea. They manufacture the product in their own factory and have been selling the product to Korean dairy farmers and pig farmers since 2011.

BioLight are searching for investment to branch out in the overseas market, starting with the US next year.
